

Size reduction with Disc Mills and Mortar Grinders

Retsch[®]
Solutions in Milling & Sieving

Vibratory Disc Mill

The RETSCH RS 200 is the ideal tool for fast and powerful grinding of sample materials for spectral analyses. It achieves grind sizes below 100 microns within seconds and with excellent reproducibility.

Hand Mortars

16

RETSCH Disc Mills and Mortar Grinders are used primarily for fine and very fine comminution of soft, hard and brittle materials. A final fineness of approx. 100 µm can be achieved with disc mills and <10 µm with mortar grinders. A maximum feed size of up to 20 mm is possible depending on the instrument used. If the grain size of the sample is greater than this, it must first be pulverized.

Preliminary Size Reduction

For **coarse and primary size reduction** RETSCH jaw crushers have proven themselves to be highly efficient. They are available in 4 different sizes. Depending on the model, they can comminute hard, brittle or tough material to a final size of 0.5 - 5 mm.

Assisting

For the subsequent pulverization a **representative part-sample** must first be obtained, e.g. with the sample divider PT 100 from RETSCH.

RETSCH offers two models of hydraulic **pellet presses** to prepare solid samples for XRF analyses

The main areas of application for Vibratory Disc Mills are:

Ceramics and Glass

Construction Materials
 cement, cement clinker, concrete

Environment
 electronic components, soil

Mineralogy and Metallurgy
 coal, coke, corundum, metal oxides, ores, slag

and many more...

Applications Vibratory Disc Mill

The RETSCH Vibratory Disc Mill is particularly suitable for rapid, loss-free grinding of hard, brittle and fibrous materials to analytical fineness. The mill is primarily used for sample preparation for spectral analysis.

Free test grinding

As part of RETSCH's professional customer support we offer our customers the individual advice required to find the optimum solution for their sample preparation task. To achieve this our application laboratories process and measure samples free-of-charge and provide a recommendation for the most suitable method and instrument.

For more information please visit our website www.retsch.com/testgrinding.

Application examples

Vibratory Disc Mill	Grinding set	Feed size	Sample amount	Grinding time	Revolution speed	Final fineness
Catalysts	50 ml Zirconium oxide	10 mm	25 g	1 min	1400 rpm	100 µm

Vibratory Disc Mill RS 200

**Fast and
reproducible**

Analytical fineness in seconds

No grinder can beat the speed of a Vibratory Disc Mill when it comes to preparing samples for spectral analyses.

Benefits at a glance

- Extremely short grinding time
- Speed range 700 rpm - 1500 rpm, freely selectable
- Quick action clamping device for grinding set
- Reproducible results
- 1-button operation with graphic display
- 10 SOPs can be defined and stored for routine applications
- Programmable starting time
- Grinding sets in different sizes and materials
- Agate recognition for automatic speed reduction
- Sealed, noise-insulated grinding chamber
- Maintenance-free
- 2-year warranty, CE-conform

The powerful drive of RETSCH'S RS 200 allows for the extremely rapid formation of the movement pattern of the grinding discs inside the jar which leads to analytical fineness after a very short grinding time. Moreover, the RS 200 provides grinding results with excellent reproducibility.

The instrument runs steadily and smoothly, even with heavy grinding sets and at maximum speed. The new **Stabilized-Plane-Drive** ensures that the main directional movement of the drive train is secured in a plane. This prevents the jar from gyrating or tumbling so that the energy is fully available for the grinding process.

Thanks to grinding sets in various materials and sizes, this mill can be used for a wide range of sample materials. With its robust design, it has proven to be very suitable for use in the building materials sector (cement), in geology, mineralogy, metallurgy and in power plants.

Vibratory Disc Mill technology

The vibratory disc mill comminutes by pressure, impact and friction. The grinding set is firmly attached to the vibration plate with a quick-action lever. The plate with the grinding set is subjected to circular horizontal vibrations. The centrifugal force acting on the grinding rings in the dish results in extreme pressure, impact and frictional forces acting on the sample, producing analytical fineness in 1-3 minutes.

The circular vibrations are produced by a frequency controlled 1.5 kW 3-phase motor. Its speed can be selected between 700 rpm - 1500 rpm in order to adapt to the characteristics of the sample material. A sensor recognizes the presence of agate grinding sets and automatically limits the speed to 700 rpm to avoid damaging the agate. The cover of the noise-insulated grinding chamber has a safety interlock and can only be opened when the mill is at a standstill.

Selection of grinding sets

Exceptionally simple and safe handling

A grinding set for the vibratory disc mill consists of a grinding dish with cover and a grinding disc. The 100 ml and 250 ml grinding sets contain an additional grinding ring.

These grinding sets feature the following advantages:

- safe, non-slip attachment with integral safety devices on cover and base
- user-friendly gripping on cover and base
- gap between dish and cover edge for easy opening
- optimal sealing with O-ring
- protective jacket made from stainless steel (for agate, zirconium oxide and tungsten carbide dishes)
- grinding set identification (article number, material and volume)
- marking field (e.g. for information about sample)

The grinding sets have been developed especially for extreme test conditions such as high sample throughput and high mechanical stress.

Grinding sets RS 200 – guidelines for sample amount

Grinding set nominal volume	Sample amount	Max. feed size
50 ml	15 - 50 ml	< 5 mm
100 ml	35 - 100 ml	<10 mm
250 ml	80 - 250 ml	<15 mm

In addition to the instrument settings, the filling level of the grinding set is also of crucial importance for a successful grinding process in vibratory disc mills. The table provides guidelines for the recommended sample amount depending on grinding sets used.

Material composition guidelines

Grinding set	Material no. or name	approx. hardness	Material analysis (in %)
Hardened steel	1.2080	62-63 HRC	Fe (85.34), Cr (12), C (2.2), Mn (0.45), Si (0.4), P (0.03), S (0.03)
Steel for heavy-metal-free grinding	1.1740	60-63 HRC	Fe (98.008), C (0.65), Mn (0.8), Si (0.4), P (0.035), S (0.035)
Tungsten carbide	WC	1180-1280 HV 30	WC (94), Co (6)
Agate	SiO ₂	6.5-7.0 Mohs	SiO ₂ (99.91), Al ₂ O ₃ (0.02), CaO (0.01), Fe ₂ O ₃ (0.01), K ₂ O (0.01), Na ₂ O (0.02), MgO (0.01), MnO (0.01)
Zirconium oxide*	ZrO ₂	1250 HV 0.5	ZrO ₂ (94.5), Y ₂ O ₃ (5.2), SiO ₂ / MgO / CaO / Fe ₂ O ₃ / Na ₂ O / K ₂ O (<0.3)

The above percentages are mean values. We reserve the right to make alterations.

*Yttrium-part-stabilized

Sample preparation for XRF analysis

RETSCHE offers the **Pellet Press PP 40** as a useful complement to sample preparation in the RS 200. The press features individual pressure force regulation from 10 to 400 kN. It not only controls the pressure force but also the pressure build-up and release during the pressing process. This reduces the internal stress on the sample and ensures that even difficult materials are pressed perfectly.

The PP 40 is available with 4 different pressing tools additionally allowing for free pressing.

Please refer to the brochure „Assisting“ for more details about the RETSCHE Pellet Presses.

The main areas of application for Disc Mills are:

Ceramics and Glass

dental ceramics, electrotechnical porcelain, glass, hydroxyapatite, sintered ceramics, steatite

Construction Materials

concrete, construction waste, granite, gypsum

Environment

dried soil samples, drilling cores, sewage sludge

Mineralogy and Metallurgy

bauxite, cement clinker, chamotte, coal, coke, ferro-alloys, ores, quartz, slag

and many more...

Applications Disc Mill

The RETSCH Disc Mill DM 200 is used for batchwise or continuous preliminary and fine size reduction of medium-hard to hard-brittle solids (up to 8 Mohs). The disc mill can grind such sample materials to an average final fineness of approx. 100 µm in one go.

Free test grinding

As part of RETSCH's professional customer support we offer our customers the individual advice required to find the optimum solution for their sample preparation task. To achieve this our application laboratories process and measure samples free-of-charge and provide a recommendation for the most suitable method and instrument.

For more information please visit our website www.retsch.com/testgrinding.

Application examples

Disc Mill	Grinding discs	Gap width	Feed size	Sample amount	Grinding time	Final fineness
Aluminium-Silicon-Oxide-Nitride	Manganese steel	0 mm	3 mm	200 g	1 min	0.5 mm
Cement Clinker	Hardened steel	0.1 mm	15 mm	250 g	5 min	0.3 mm

Disc Mill DM 200

Suitable for hardness
up to 8 Mohs

DM 200

Benefits at a glance

- Accurate gap setting for reproducible grinding results
- Short grinding times, high final fineness
- Contamination-free grinding with grinding discs made from 4 different materials
- Grinding discs with long working life
- Easy cleaning
- Dust-free grinding thanks to connector for dust extraction
- Maintenance-free 3-phase geared motor
- 2 year warranty, CE-conform

Grinding even the hardest products

Thanks to its robust design, the RETSCH Disc Mill DM 200 can be used under rough conditions in laboratories and pilot plants, as well as online for the quality control of raw materials.

A particular advantage of the mill is the **large sample feed size**, with an edge length of up to 20 mm. The final fineness – which can be as high as 100 microns - depends on the set grinding disc gap width and the breaking properties of the particular sample. The powerful DM 200 usually requires only a few minutes to achieve the desired grind size.

The gap between the grinding discs can be adjusted – even during operation – via a scale with an accuracy of 0.1 mm. This ensures reproducible grinding results.

The RETSCH Disc Mill DM 200 is very simple to operate. When the grinding process is finished, the hinged grinding chamber can be opened completely so that the mill is fully accessible for cleaning and changing the grinding discs. The DM 200 can be equipped with an optional connecting piece for a dust exhaust system which allows for removal of fine dust during grinding.

Disc Mill technology

The feed material enters the dust-proof chamber from the filling hopper and is fed centrally between two vertical grinding discs. A moving grinding disc rotates against a fixed one and draws in the feed material. The necessary size reduction effects are generated by pressure and frictional forces. The progressively arranged teeth of the grinding disc first subject the sample to preliminary crushing; centrifugal force then

moves it to the outer regions of the grinding discs where fine grinding takes place. The processed sample exits through the grinding gap and is collected in a receiver. The gap width between the grinding discs is continuously adjustable during operation in the range between 0.1 and 5 mm; an additional observation window is provided for checking the gap setting.

Selection of grinding discs

A set of grinding discs for the DM 200 consists of a fixed and a rotating grinding disc. The material should be selected so that contamination of the sample is avoided and abrasion minimized. 4 different materials are available.

For standard size reduction,

e.g. minerals with Mohs hardness 3 - 6

- grinding disc set made from hardened steel or manganese steel

For extreme size reduction,

e.g. minerals with Mohs hardness >6

- grinding disc set made from tungsten carbide (WC)

For heavy-metal-free size reduction,

e.g. dental ceramics

- grinding disc set made from zirconium oxide

After a long period of use the grinding discs will show signs of mechanical wear. However, before they need to be replaced by new ones, the opposite side of the teeth can also be used by changing the direction of rotation of the motor. This considerably extends the working life of the grinding discs.

Material composition guidelines

DM 200 Grinding discs	Material no. or name	approx. hardness	Material analysis (in %)
Hardened steel	1.2601	60-62 HRC	Fe (83.59), Cr (12), C (1.75), Mo (0.7), W (0.6), V (0.5), Si (0.4), Mn (0.4), P (0.03), S (0.03)
Manganese steel	1.3401	**	Fe (ca. 83.6 - 85), C (1.1-1.3), Si (0.3-0.5), Mn (12-13), P (0.1), S (0.04), Cr (1.5)
Tungsten carbide	WC	1180-1280 HV 30	WC (90.3), Co (9.5), TaC (0.2)
Zirconium oxide	ZrO ₂	1200 HV	ZrO ₂ (94.8), HfO ₂ (1.5), SiO ₂ (<0.1), Al ₂ O ₃ (<0.1), Fe ₂ O ₃ (<0.05), CaO (<0.05), MgO (<3.1-3.3), Na ₂ O (<0.03), others (<0.1)

The above percentages are mean values. We reserve the right to make alterations.

** no information about hardness available

Strong combination: Pre- and fine grinding in one step

Progressive size reduction with excellent results

The Disc Mill DM 200 grinds the sample material by pressure and frictional forces between a moving and a fixed grinding disc. The progressively arranged teeth of the grinding discs in the central area pre-crush the sample before it is finely ground in the outer region. **This special grinding disc shape allows even very hard samples to be comminuted efficiently.** The ground material then falls through the grinding gap into a receptacle and can be easily recovered for further treatment.

For the rapid, continuous grinding of large quantities of coarse material to analytical fineness, the combination of the RETSCH Jaw Crusher BB 200 and the RETSCH Disc Mill DM 200 is the perfect solution. The crusher is mounted above the disc mill on a frame and both instruments are connected by a chute. With this construction, samples of up to 90 mm feed size can be ground down to 100 microns in one single step.

The main areas of application for Mortar Grinders are:

Agriculture

oil seeds, plant material, soil

Biology

frozen yeast cells

Ceramics and Glass

Chemicals

Construction materials

cement clinker, tiles

Food

cocoa nibs, nuts, spices

Medicine / Pharma

pharmaceutical and homeopathic raw materials and finished products

Mineralogy and Metallurgy

quartz, salts, silicates, slag

and many more...

Applications Mortar Grinder

RETSCH Mortar Grinders comminute inorganic and organic substances to analytical fineness. They can mix and homogenize powders, suspensions and pastes. The grinders are also ideal for the uniform trituration of homeopathic and pharmaceutical products.

Soft, hard, brittle and pasty materials with a hardness of up to 9 on Mohs scale can be processed easily in RETSCH mortar grinders.

Free test grinding

As part of RETSCH's professional customer support we offer our customers the individual advice required to find the optimum solution for their sample preparation task. To achieve this our application laboratories process and measure samples free-of-charge and provide a recommendation for the most suitable method and instrument.

For more information please visit our website www.retsch.com/testgrinding.

Application examples

Mortar Grinder	General remarks	Grinding set	Pestle pressure	Feed size	Sample amount	Grinding time	Final fineness
Coated tablets		Agate	3	10 mm	5 g	5 min	200 µm
Cocoa nibs	pre-heating to 60 °C	Hard porcelain	4	10 mm	75 g	20 min	75 µm

Mortar Grinder RM 200

The unmatched original

Benefits at a glance

- Wet and dry grinding
- Reproducible results by adjustment of the pestle pressure (via a scale) and digital time setting
- 7 different grinding set materials
- Performance display
- Easy exchange of pestle and mortar without tools
- Closed, dust-tight grinding chamber with windows
- High-performance drive with electronic control
- Very easy to clean
- 2-year warranty, CE-conform

Grinding, mixing, trituration

RETSCHE mortar grinders are suitable for reproducible sample preparation for subsequent analysis within the framework of quality assurance and GLP as well as for the preparation of prescriptions and formulations. Samples that are difficult to comminute can be successfully processed in mortar grinders by heating or cooling them, or by using grinding aids.

Mortar Grinder technology

Mortar grinders comminute, mix and triturate by pressure and friction. The function of the scraper is to feed the material into the area between the mortar and pestle. This forced feed ensures that the whole of the sample is continuously subjected to the grinding and trituration process and is also intensively mixed. The pestle is not located in the center of the mortar but is offset; contact with the rotating mortar and the sample causes it to

rotate automatically. The necessary grinding pressure is achieved by the weight of the pestle itself combined with the adjustable spring pressure acting on its axis.

RM 200

Safe and convenient

The RM 200 is a dust-tight closed comminution system that can be used for dry and wet grinding. With a useful volume of 10 to 190 ml it is possible to achieve a final fineness of $<10 \mu\text{m}$. The maximum feed size of the product depends on the properties of the material and is approx. 8 mm. The choice of a grinding set of 7 different materials allows **neutral-to-analysis sample preparation**.

The sample or grinding additives such as liquids can be added during operation via the right-hand Plexiglas window in the grinding compartment cover. The grinding process can be observed through the large windows.

The grinding time is set digitally between 0 and 99 minutes, continuous operation is also possible. In addition to the grinding time, the contact pressure of the pestle as well as its position in the mortar also has a considerable influence on the grinding results. The contact pressure can easily be set via a scale (1) on the cover of the RM 200. The positions of the pestle and the scraper are adjusted with the help of knobs (2).

The RM 200 features a performance display (3) which indicates the current workload of the mill. This helps to adjust the pestle pressure to the most suitable position.

The grinding chamber cover has a safety switch that cuts off the motor when the cover is raised. An electronic load and speed control protects the motor against overloading.

*depending on feed material and instrument configuration/settings

The original "Retsch Mill"

More than 80 years ago F. Kurt Retsch took out his first patent for a grinding instrument: a mortar grinder that became well-known throughout the world as the "Retsch Mill". Until 1923 heavy hand-operated mortars were the common tool for size reduction in laboratories. It frequently took hours of tiresome grinding until the material had achieved the necessary degree of fineness. However, when he invented the first mechanical mortar grinder,

F. Kurt Retsch put an end to all this, which brought both him and his company worldwide respect in the fields of science and research. Since then the "Retsch Mill" has been substantially enhanced and perfected and a complete family of laboratory mills and grinders has been added to the program which meets the latest requirements of GLP and CE.

F. Kurt Retsch and the original "Retsch Mill"

Selection of grinding sets

Mortar and pestle made of 7 different materials

The choice of the suitable grinding set material depends primarily on the hardness of the sample and the possible effects of any abrasion on the subsequent analysis or further processing. For example, the DAB (Deutsches Arzneimittel Buch – German Pharmacopoeia) stipulates the use of hard porcelain grinding sets for the preparation of pharmaceutical and homeopathic products.

For soft to medium-hard or pasty substances grinding sets made from hard porcelain or sintered aluminum oxide (Al_2O_3) are usually adequate.

For processing **hard, abrasive substances, for long-term and for heavy-metal-free processing**, we recommend the use of grinding sets

made from agate, zirconium oxide or tungsten carbide.

For less demanding applications, also **under rough conditions**, grinding sets made from hardened steel or stainless steel should be used. Stainless steel is also the material of choice for the grinding of frozen yeast cells.

The standard scraper is made from abrasion-resistant Vulkollan. A special version made from beech wood is available as an option for use in the pharmaceutical sector. A PTFE scraper is particularly suitable for cryogenic grinding.

The mortar of the RM 200 has a maximum useful volume of 190 ml.

Tips for optimum results

- Samples that are difficult to grind can be cooled or processed by using grinding aids.
- For the preparation of pastes the mortar containing the sample (e.g. cocoa nibs) should first be heated in a temperature cabinet.
- The addition of Aerosil® helps to avoid caking when grinding pharmaceutical products.
- Pure quartz sand can be added as a grinding aid when processing oil seeds (rape seed, soybean, mustard, etc.).

Material composition guidelines

Grinding set	Material no. or name	Mortar Pestle	approx. hardness	Material analysis (in %)
Hardened steel	1.2080	■	60 HRC	Fe (85.34), Cr (12), C (2.2), Mn (0.45), Si (0.4), P (0.03), S (0.03)
	1.2379	■	58-60 HRC	Fe (84.5), Cr (11.5), C (1.55), V (0.95), Mo (0.75), Mn (0.3), Si (0.4), P (0.015), S (0.015)
Stainless steel	1.4034	■ ■	48-52 HRC	Fe (84.5), Cr (13), C (0.42), Mn (1), Si (1), P (0.05), S (0.03)
Tungsten carbide	WC	■ ■	1180-1280 HV 30	WC (94), Co (6)
Agate	SiO_2	■ ■	6.5-7.0 Mohs	SiO_2 (99.91), Al_2O_3 (0.02), Na_2O (0.02), Fe_2O_3 (0.01), K_2O (0.01), MnO (0.01), MgO (0.01), CaO (0.01)
Sintered alum. oxide	Al_2O_3	■ ■	1750 HV	Al_2O_3 (99.7), SiO_2 (0.075), MgO (0.075), CaO (0.07), Na_2O (0.01), Fe_2O_3 (0.01)
Zirconium oxide*	ZrO_2	■ ■	1200 HV	ZrO_2 (94.5), Y_2O_3 (5.2), SiO_2 / MgO / CaO / Fe_2O_3 / Na_2O / K_2O (<0.3)
Hard porcelain		■ ■		SiO_2 (68.5), Al_2O_3 (26.1), K_2O (3.92), Fe_2O_3 (0.52), MgO / CaO / Na_2O / TiO_2 (<0.2)

The above percentages are mean values. We reserve the right to make alterations.
*Yttrium-part-stabilized

Mortar grinder order data

Mortar Grinder RM 200		Item No.	Item No.
Mortar Grinder RM 200 (please order mortar and pestle separately)			
RM 200	for 230 V, 50 Hz		20.455.0001
RM 200	for 110 V, 60 Hz		20.455.0003
RM 200	for 120 V, 60 Hz		20.455.0004
Mortars and pestles for RM 200		Mortar	Pestle
Material	hardened steel	02.460.0018	02.461.0112
	stainless steel	02.460.0057	02.461.0113
	tungsten carbide	02.460.0021	02.461.0114
	agate	02.460.0098	02.461.0115
	sintered aluminum oxide	02.460.0017	02.461.0116
	zirconium oxide	02.460.0086	02.461.0117
	hard porcelain	02.460.0016	02.461.0118
Accessories for RM 200			
Scraper, beech wood			22.008.0025
Scraper, PTFE (e.g. for cryogenic grinding)			22.008.0024
Spare scraper, Vulkollan			22.862.0012
Additional items for RM 200			
IQ/OQ documentation for RM 200			99.200.0012

Agate hand mortars

Hand mortars made from agate are particularly suitable for grinding, mixing and triturating medium-hard to hard substances. Agate is extremely abrasion-resistant and very pure (99.9% SiO₂). This guarantees its neutrality for the subsequent analysis.

The quality of RETSCH hand mortars is particularly high. The abrasion surfaces are smooth and flawless, the outer surfaces are uniformly ground.
